

JSON Extraction

The payload formatter results for an application or device is included in the `uplink_message` section, here is an example:

```
"uplink_message": {
  "session_key_id": "AXtU+eEB5V4Z/RU0VCSGWQ==",
  "f_port": 1,
  "f_cnt": 2,
  "frm_payload": "AN5cpy74AQ4=",
  "decoded_payload": {
    "AR": 167,
    "DE": 222,
    "Flags": 0,
    "MCUTemp": 20.239999999999995,
    "SC": 92,
    "X": 1,
    "Y": 14
  },
}
```

The Python & PHP extracts data from the `uplink_message` section already. You will need to refer to the `decoded_payload` section which will give you access to the fields from your payload formatter.

Both the Python & the PHP show how you access the different elements of the JSON.

Extract one or more fields from your decoded payload and print them to the console.
